This is the human poly (ADP-ribose) polymerase protein (PARP) sequence.

PARP is a 116kD DNA-binding protein that binds tightly to single-strand double-strand breaks. The PARP protein and Escherichia coli UvrA and UVIB proteins (see AAY58041-Y58442) are used in a method for the detection and quantitation of DNA base damage. The method involves quantifying at least one modification of interest in a nucleic acid sequence through the used of capillary electrophoresis, laser induced fluorescente and a fluorescently labeled polypeptide (e.g. fluorescently labeled polypeptide (e.g. fluorescently labeled anti-PARP antibody) that is specific for the modification. The new method is useful for quantifying nucleic acid modifications, especially a mutation (including deletions, insertions and substitutions), mismatch, DNA adduct, or strand break (single or double). The method is useful for identifying and detecting exposure to carcthogens, and in early risk assessment for cancer, and is

                                                                                                                                                                                                                                                                                                                                                                                                                                                 17;
                                                                                                                                                                                            The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, meurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            410

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequence for thuman tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation ctelomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | : | | : || | | | :: | | |: :|:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete poly(adenosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic effects of DNA damage (caused by alkylating or oxidizing agents or radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for cancer prevention in subjects at high risk (e.g. those with tumor-associated genetic defects). Tumor cells treated with (A) show an increased tendency to die when treated with radiation or chemotherapeutic

computes, sbhPARS2. The invention also relates to fragments, variants and sequences with intention also relates to fragments, variants and sequences with at least 95% identity to the sbhPARS2 conclections or nucleotide sequence; expression systems and host cells computising an sbhPARS2 nuclectic acid sequence; the recombinant expression of sbhPARS2; and an antibody specific for sbhPARS2. sbhPARS2 proteins compounds which inhibit or stimulate its activity or expression level. It such a mammal. The sbhPARS2 protein is useful for identifying compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of sbhPARS2 are useful for treating human cardiac ischaemia, myocardial infarction, stroke), inflammantion, autoimmune disease (e.g. diabetes, multiple sclerosis) and neurodegenerative diseases (e.g., Parkinson's disease and Alzheimer's disease). sbhPARS2 nucleic acids are useful as diseases and Alzheimer's detecting mutations in the associated gene; as hybridisation probes to isolate full-length sbhPARS2 cDNAS and sbhPARS2 protein is also useful as an immunogen to produce antibodies for therapeutic use. sbhPARS2 consening methods for detecting the effect of added compounds on the production of mRNA and protein in cells.
                                                                                                                                                                                                                                                                                                    New human polypeptide of the polyADPribose synthetase family for use in diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease
                                                                                                                                                                                               Zhu Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence represents a novel human poly(ADP-ribose)
                                                                                                                                                                                               Li X, McQueney MS,

This invention describes novel human and murine poly(ADP-ribose) polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD⁺+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2MXX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and antibodies are useful for analytic binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP2 protein used in the method of the invention.

controlled trauma or massive bleeding, especially apoplexy or spinal-cranial trauma or massive bleeding, especially apoplexy or spinal-cranial trauma; or Alzheimer's disease, Huntington's disease or parkinson's disease, Treating or preventing ischemic damage after candidated sachemic damage after renal ischemia or during and after (specifically renal damage after renal ischemia or during and after kidney transplantation or heart damage after cardiac ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. petit mal and conjex partial epileptic attacks (e.g. petit mal and conjex partial attacks), treating microinfarction (e.g. during and after heart valve replacement, aneurysm resectioning and heart transplantation), revascularization of critically constricted coronary arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. leg arteries), treating acute myocardial ischemia and damage during or after its mechanical or drug'induced lysis and treating tumors and cliesase (e.g. rheumatoid arthritis), and diabetes mellitus. Although (I) inhibit pare (i.e. the known form designated parel), they especially constituellar (I) have very strong PARP), they especially pare particular (I) have very strong PARP2 inhibitory aclivity (e.g. with K_i values of 1-20 nM) and highs electivity for PARP2 relative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly (ADP-Those)-polymerase (PARP: EC 2.4.2.30) activity. The products of the invention have nootropic, neuroprotective, cerebroprotective, antiparkinsonian, nephrotropic, cardiant, vasotropic, antionament, oytostatic, antibacterial, immunosuppressive, antinflammatory, antirheumatic, antiarthritic, antidiabetic. (I) are especially used for treating or preventing neurodegenerative disease or neuronal damage (specifically associated
                                                                                                                                                                                                                                                                                                                                                          Drugs for inhibiting PARP or especially homologous enzymes comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            235

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Bablychuk, E.; Cottrill, P.; Storozhenko, S.; Fuangthong, M.; O'Farrell, M.; Van Monta submitted to the EMBL Data Library, November 1997
A. Description: Higher plants possess two poly(ADP-ribose) polymerases.
A. Reference number: 214992
A. Accession: T03657
A. Molecule type: mRNA
A. Residues: preliminary; translated from GB/EMBL/DDBJ
A. Molecule type: mRNA
A. Residues: 1-969 < ABB>
A. Cross-references: EMBL.AJ22589; PIDN:CAA10889.1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUE-Kidney;
Ansorge W., Wirkner U., Mewes H.-W., Gassenhuber J., Wiemann S.;
Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor =
nicotinamide + {AADP-D-ribosyl}(N+1)-acceptor =
-!- SUBCELLUIAR LOCATION: Nuclear (Potential)
-!- TISSUE SPECIFICITY: Widely expressed; the highest levels are in
the kidney, skeletal muscle, liver, heart and spleen; also
detected in pancreas, lung, placenta, brain, leukocytes, colon,
small intestine, ovary, testis, prostate and thymus.
-!- SIMILARITY: BELONGS TO THE PARP FAMILY.
                                   PPO3_HUMAN STANDARD; PRT; 533 AA.

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor. COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN (BY
                                                                                                                      SUBGULT: HOMODIMER (Potential).
SUBCELULLAR LOCATION: Nuclear.
MISCELLANGOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELE, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
THE TREMINAL ADBENOSINE MOLETY, BUILDING UP A POLYMER WITH AN
AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS 1 BRCT DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"pADPRT-2: a novel mammalian polymerizing(ADP-ribosyl)transferase gene related to truncated pADPRT homologues in plants and Caenorhabditis
                                                     -i- FUNCTION: HAS DNA DEPENDENT POLY (ADP-RIBOSE) POLYMERASE ACTIVITY.

SEEMS TO PLAY A ROLE IN THE RESPONSE TO DNA DAMAGE.

-i- CATALYTIC ACTIVITY: NAI+ + (ADP-D-ribosyl)(N)-acceptor—
nicotinamide + (ADP-ribosyl)(N+1)-acceptor.

-i- SUBCELLULAR LOCATION: Nuclear.

-i- TISSUE SPECIFICITY: Widely expressed; the highest levels were in testis followed by ovary.

-i- INDUCTION: By high levels of DNA-damaging agents.

-i- SIMILARITY: BELONGS TO THE PARP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               143
